

INSTRUCTOR GUIDE

ODM Adoption Workshop

Facilitate the “Establish a Baseline” module

Outcome-Driven Management

Facilitator purpose

Help participants build a shared baseline from observable management behavior, then convert the baseline into one bounded ODM adoption bet. The instructor should guide inquiry, not declare a maturity score.

Facilitation safeguard: Do not use workshop artifacts to rank individuals or teams. Keep examples depersonalized. Treat disagreement as evidence that the system lacks shared understanding.

Recommended audience

- Cross-functional leadership team
- Engineering, product, design, operations, and customer representatives
- A facilitator and a visible decision owner

Preparation

- Select one meaningful initiative or decision environment to anchor exercises.
- Ask participants to bring current review artifacts, dashboards, reports, and examples of recent decisions.
- Print one participant workbook per person.
- Prepare wall space or virtual boards for a shared behavior map, signal inventory, and attention profile.
- Confirm that the session will produce an adoption bet, not an organizational score.

Suggested agenda

Opening and working agreements	15 min
Exercise 1 — Observable Behavior Inventory	25 min
Exercise 2 — Outcome Traceability Test	25 min
Exercise 3 — Evidence Audit	30 min
Break	10 min
Exercise 4 — Decision Flow Analysis	30 min
Exercise 5 — Leadership Attention Profile	25 min
Exercise 6 — Baseline Summary and Adoption Bet	30 min

Commitments and close	15 min
-----------------------	--------

Exercise 1

Observable Behavior Inventory

Objective: Make recurring management behavior visible without blaming people.

Facilitation sequence

1. Invite silent individual inventory before group discussion.
2. Build one shared list. Consolidate duplicates only after meaning is clear.
3. Ask participants to classify each item as primarily Activity, Outcome, Evidence, Decision, or Learning focused.
4. Use dot voting to identify behaviors that consume the most time and those that create the most value.
5. Select one behavior for deeper examination in later exercises.

Watch for

- Participants listing desired behaviors instead of current behavior.
- Personal attribution or naming a person as the problem.
- Treating all activity-focused behavior as waste; some activity signals are useful when connected to decisions.

Debrief prompts

- What is visible in the system today?
- Where does the organization spend attention without improving understanding?
- Which behavior creates learning or a decision?

Required artifact: Current Management Behavior Map and one selected behavior.

Outcome Traceability Test

Objective: Test whether a major initiative has a shared, measurable definition of success.

Facilitation sequence

1. Choose one current initiative that matters and is familiar to the room.
2. Ask participants to draft the intended outcome independently.
3. Compare wording. Surface differences before creating a shared version.
4. Identify beneficiaries, customer impact, business or operational impact, leading indicators, and lagging proof.
5. Use the clarity check to identify the weakest element.

Watch for

- Outputs disguised as outcomes, such as “launch,” “deliver,” or “complete.”
- Measures that describe production but not meaningful change.
- A single participant defining the outcome for the whole group.

Debrief prompts

- Would two teams make the same tradeoff using this outcome?
- What evidence would increase confidence that value is being created?
- What decision will the outcome indicators inform?

Required artifact: Outcome Clarity Snapshot and one clarification action.

Exercise 3

Evidence Audit

Objective: Distinguish actionable signals from reporting noise and reveal missing evidence.

Facilitation sequence

1. Collect the reports, dashboards, metrics, and qualitative inputs used today.
2. For each item, ask what decision it has changed recently.
3. Classify the item as Signal, Noise, or Unknown.
4. Identify duplicated information and gaps across customer, execution, engineering, business, and organizational evidence.
5. Agree on stop, keep, simplify, and add actions.

Watch for

- Calling a metric a signal merely because it is important.
- Defending reports based on historical expectation rather than current decision value.
- Ignoring qualitative evidence or customer context.

Debrief prompts

- What action becomes possible because this information exists?
- What information creates the illusion of control?
- What evidence is needed for the next decision?

Required artifact: Signal Inventory with stop, keep, simplify, and add actions.

Exercise 4

Decision Flow Analysis

Objective: Reveal ownership, evidence, and latency constraints in one real decision.

Facilitation sequence

1. Choose a recent decision with material consequence.
2. Reconstruct the trigger, owner, evidence, elapsed time, choice, and follow-through.
3. Mark where the decision waited and why.
4. Identify missing evidence and unclear boundaries.
5. Define one improved decision pattern to test.

Watch for

- Debating whether the decision was “right” instead of examining the process.
- Retrospective blame. Keep focus on system conditions.
- Confusing an action item with a decision.

Debrief prompts

- Was ownership explicit?
- Did the decision happen at the right time?
- What evidence was necessary versus merely available?
- Did the decision establish the next evidence?

Required artifact: Decision Flow Reflection and one improvement action.

Exercise 5

Leadership Attention Profile

Objective: Compare current and desired leadership attention across five decision domains.

Facilitation sequence

1. Give each participant 100 points for current attention allocation.
2. Aggregate current allocations and discuss differences.
3. Repeat for desired attention.
4. Compare gaps across Strategic Outcomes, Execution Health, Engineering Excellence, Customer Signals, and Organizational Effectiveness.
5. Choose one review behavior to shift attention.

Watch for

- Treating equal allocation as the goal. The right mix depends on context.
- Using the exercise to criticize a leadership role.
- Confusing information quantity with attention quality.

Debrief prompts

- What receives attention because it is easy to measure?
- What domain receives attention only after escalation?
- Which shift would most improve decisions?

Required artifact: Leadership Attention Profile and one attention-shift experiment.

Baseline Summary and Adoption Bet

Objective: Convert workshop evidence into one bounded adoption experiment.

Facilitation sequence

1. Review all five artifacts.
2. Name strengths before constraints.
3. Select one learning opportunity with a clear link to an important outcome or decision.
4. Draft an adoption bet using behavior, expected improvement, evidence, context, and review point.
5. Confirm the decision owner and possible decisions: continue, adapt, scale, or stop.

Watch for

- Choosing a broad transformation instead of a bounded experiment.
- Defining success as completion of a new ceremony.
- Selecting evidence that cannot change the decision.

Debrief prompts

- What behavior must become observably different?
- What is the smallest responsible context for testing this bet?
- What result would cause us to stop or adapt?

Required artifact: Baseline Summary Canvas and one bounded ODM adoption bet.

Synthesis guidance

Use the artifacts as a connected evidence chain rather than independent worksheets.

Behavior Map	What the system repeatedly does.
Outcome Snapshot	Whether the system has shared direction.
Signal Inventory	What the system notices and ignores.
Decision Reflection	How the system turns evidence into action.
Attention Profile	Where leadership focuses and intervenes.
Adoption Bet	What behavior the system will test changing next.

Close the workshop

- Read the adoption bet aloud and confirm shared understanding.
- Name the decision owner and the next review point.
- Define where artifacts will be stored and how learning will be captured.
- Ask each participant for one personal behavior change.
- Reinforce that the baseline will be revisited as evidence, not used as a permanent label.

Facilitator close: “The baseline is useful only if it helps us choose a better next experiment and make a clearer decision.”

Instructor observation sheet

Where participants had strong shared understanding

Where interpretation diverged

Signals or decisions that need follow-up

Risks to the adoption experiment

Facilitation improvements for the next session

Source-aligned principles

The workshop design uses these documented principles and information domains as grounding for the baseline exercises.

- Outcomes over activity
- Signal over noise
- Continuous situational awareness
- Rapid decision making
- Accountability with transparency
- Strategic Outcomes
- Execution Health
- Engineering Excellence
- Customer Signals
- Organizational Effectiveness

Brand note: The available source document uses the prior Mission Control name. These workshop materials apply the approved Decision Center branding while retaining the documented leadership-system capabilities.
